Abstract. Proton (^{1}H) and Carbon (^{13}C) Nuclear magnetic resonance and Ultraviolet-Visible spectrum was simulated for (1R*,2R*,4S*)-5-(5,5-Dimethyl-1,3-dioxan-2-yl)-8, 8-dimethoxy -7-oxobicyclo [2.2.2] oct-5en-2-yl Cyanide (DDO). By using Gauge Independent Atomic Orbital method, chemical shifts were generated and compared with its corresponding experimental values DDO. To understand the origin of chemical reactivity and Ultraviolet-Visible spectrum, FMO parameters measured. Non-linear optical parameters were calculated.

INTRODUCTION

(1R*, 2R*, 4S*)-5-(5,5-Dimethyl-1,3-dioxan-2-yl)-8, 8-dimethoxy -7-oxobicyclo [2.2.2]oct-5en-2-yl Cyanide (DDO) and synthesis part and experimental data reported by Santhosh et al.[1] This compound comes under the category of (MOBs) masked o-benzo-quinones.[2] A Cylcoaddition reaction plays a vital role in preparation of antiglaucoma compounds[3] and many natural products.[4,5] We recently reported the results of such biologically active molecules.[6-16] Hence, we undertook this work with the following goals.

- calculate NMR shifts (^{1}H and ^{13}C) and examine their relationship with measured[1] values,
- simulated UV-Visible spectrum and,
- NLO, MESP and FMO parameters to make the investigation comprehensive.

COMPUTATIONAL ASPECTS

By means of DFT/6-311++G(d,p) rank of conjecture and executed with Gaussian Window 09 program[17,18] simulated NMR[18] and UV-Vis spectrum.[19-21] We determined Chemical reactivity[22-25] of selected molecule DDO.

RESULTS

Most stable conformer

Chosen sample is optimized with the above mentioned method. The calculated geometrical parameters compared with observed values[1] and are shown in Table.1. Its optimized energy: -2869.026 $\times 10^{-3}$ k Jmol^{-1}. DDO comes under C_1 symmetry point group structure and is depicted in figure 1.

NMR SIGNALS

To verify the correlation between the calculated and experimentally observed NMR shifts, we drawn the graphs of observed chemical shifts verses computed chemical shifts for DDO. These are straight lines as shown

International Conference on Research in Sciences, Engineering, and Technology

in figure 2 for ^{13}C and ^{1}H NMR spectra. Coefficient of association r^2 is extremely close up agreement to accord for ^{1}H and ^{13}C NMR spectra of chosen molecule. It is clear that the theoretical and experimental chemical signals are well agreed, and can be evidenced from figure 2.

UV-VISIBLE PEAKS

Computed UV-Vis absorption peaks obtained in the computations are due to the electronic transitions. HOMO and LUMO determine the reactivity of the selected compound.[26] Electron donor is HOMO and acceptor is LUMO.[27,28] The calculated peaks at λ_{max} = 318.35 nm, its oscillator strength, f = 0.0060 and another one observed at λ_{max} = 240.84 with f = 0.0416 and are shown in figure 4. The origin of the signals is mainly due to the transitions of H→L and H-1→L for DDO.

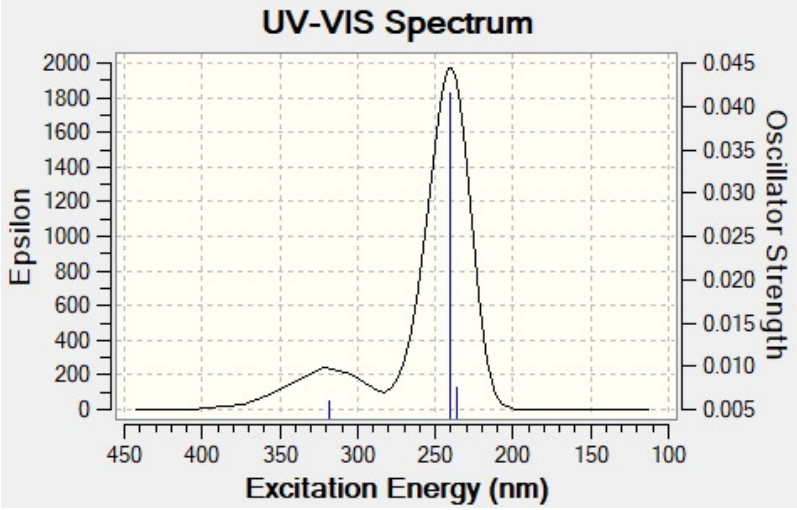

FIGURE 3: UV-Vis peaks

CHEMICAL REACTIVITY OF THE MOLECULE DDO

Frontier molecular orbital energy gap plays vital role in understanding the chemical reactivity such as reactants kinetic characteristics and chemical reactions of the molecule. The calculated energy gap between H and L: 4.040 eV (figure 5) and the chemical potential (μ = -7.238 eV) is negative for DDO, and is chemically

stable.[29,30] These parameters describe aspects like drug design and toxicological behavior of eco system.

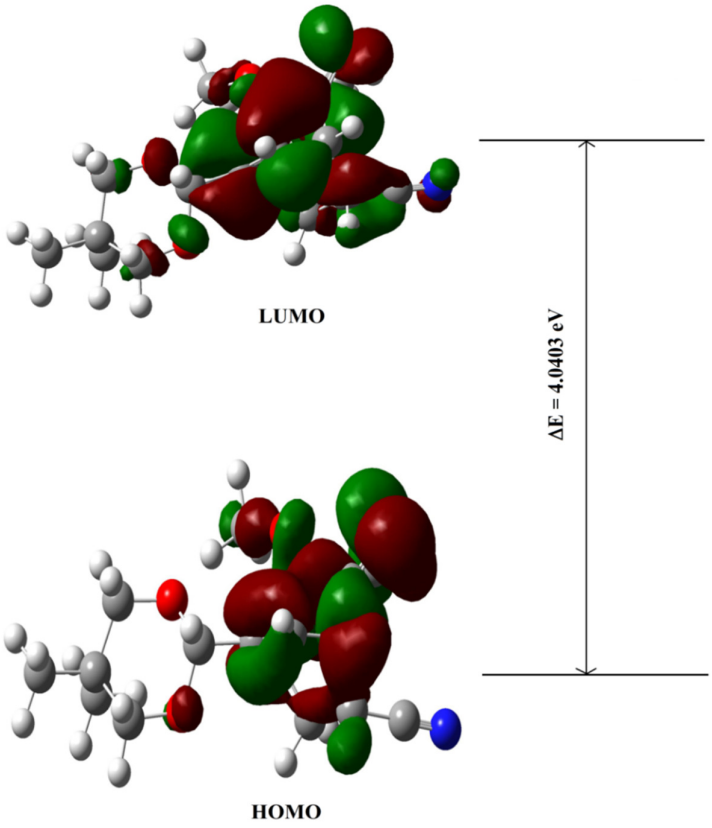

FIGURE 4: HOMO and LUMO plots of DDO

MOLECULAR ELECTROSTATIC SURFACE POTENTIAL OF DDO

The total electron density plot of DDO (see figure.6) shows the difference between charge distributions among various parts of a given molecule[31]. In figure 5, relatively negative regions are shown in red and relatively positive region is shown in green. The negative region, indicated in red is primarily over the N and O atomic positions, caused by the donation of oxygen and atoms of nitrogen (lone-pair electrons), whereas the positive section designated in green is over the remaining atoms.

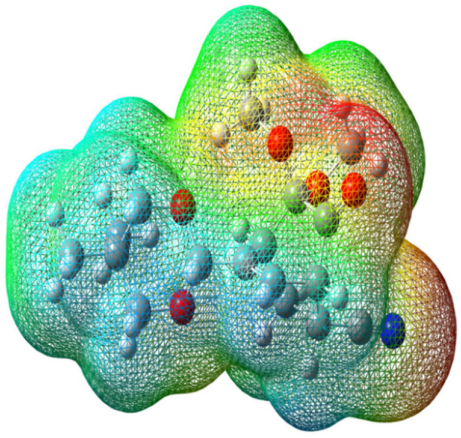

FIGURE 5: Total electron density plots of DDO

NON-LINEAR OPTICAL (NLO) BEHAVIOUR

NLO behaviour of chosen sample confirmed by comparing the Urea values of μ_t and β_t. (Urea μ_t :1.3732 Debye and β_t : 372.8×10^{-33} cm^5/e.s.u). Values of DDO are μ_t : 3.279 Debye and β_t : 391.279×10^{-33} cm^5/e.s.u. Hence it can be concluded that DDO is a good NLO materials.[32-36]

CONCLUSION

The following inferences are drawn from the computations:

- DDO molecule has the non-planar structure acquiring point group of C_1 symmetry. Theoretical computed geometric parameters of DDO are good in agreement with the values of XRD.
- Good correlation between the theoretical and experimental NMR signals.
- Theoretical UV-Vis peaks identified.
- Electron density plot was drawn and thermal energies were also estimated for DDO.
- DDO is a excellent contender for enlargement of novel NLO materials.
